# Outline :

- Introduction
- What it is the Go-Tech dashboard ?
- Data overview and preprocessing techniques
- How it work ?
- key functionalities
- Conclusion

# Introduction

In a global context where data drives all major activities, **the absence** of structured **data management** in many of our hospitals limits their ability to make informed decisions. This is especially true for blood donation campaigns, where *data analysis, interpretation, and feedback* are often overlooked despite their potential **to improve outcomes** and **save lives**.

# What it is Go-Tech dashboard ?

**We present an interactive and intuitive dashboard designed to help users go over key insights from raw structured blood donation data which will enable better understanding, faster decision-making, and improvement in campaign strategies.**

**The dashboard is particularly focus on:**

**Visualize trends in blood donation by location, time period, and donor profile.**

**Identify high-performing and underperforming campaigns to guide strategic planning.**

**Facilitate timely feedback to organizers and stakeholders through real-time insights using predictions.**

# Data overview

The dashboard is powered by structured data extracted from spreadsheets detailing 1915 individuals who participated in blood donation campaigns in cameroon. They where observed on 40 covariates divide into logistic,demographic and health-related Informations.

## Preprocecing techniques

The main work done to make the data usable in the analysis was essentialy to :

formalise the date column, adopt strategies like next value replacing or local average for date missing values.

map effectively the quater to their good arrondissement, normalise categorical missing values.

add necessary column for the analysis like Age,ville..

Drop column with more than 85% off missing values which was juged to be unnecessary like "Taille " and "Poids".

# How it work ?

The dash board is divide into trhee parts.

## The side-bar :

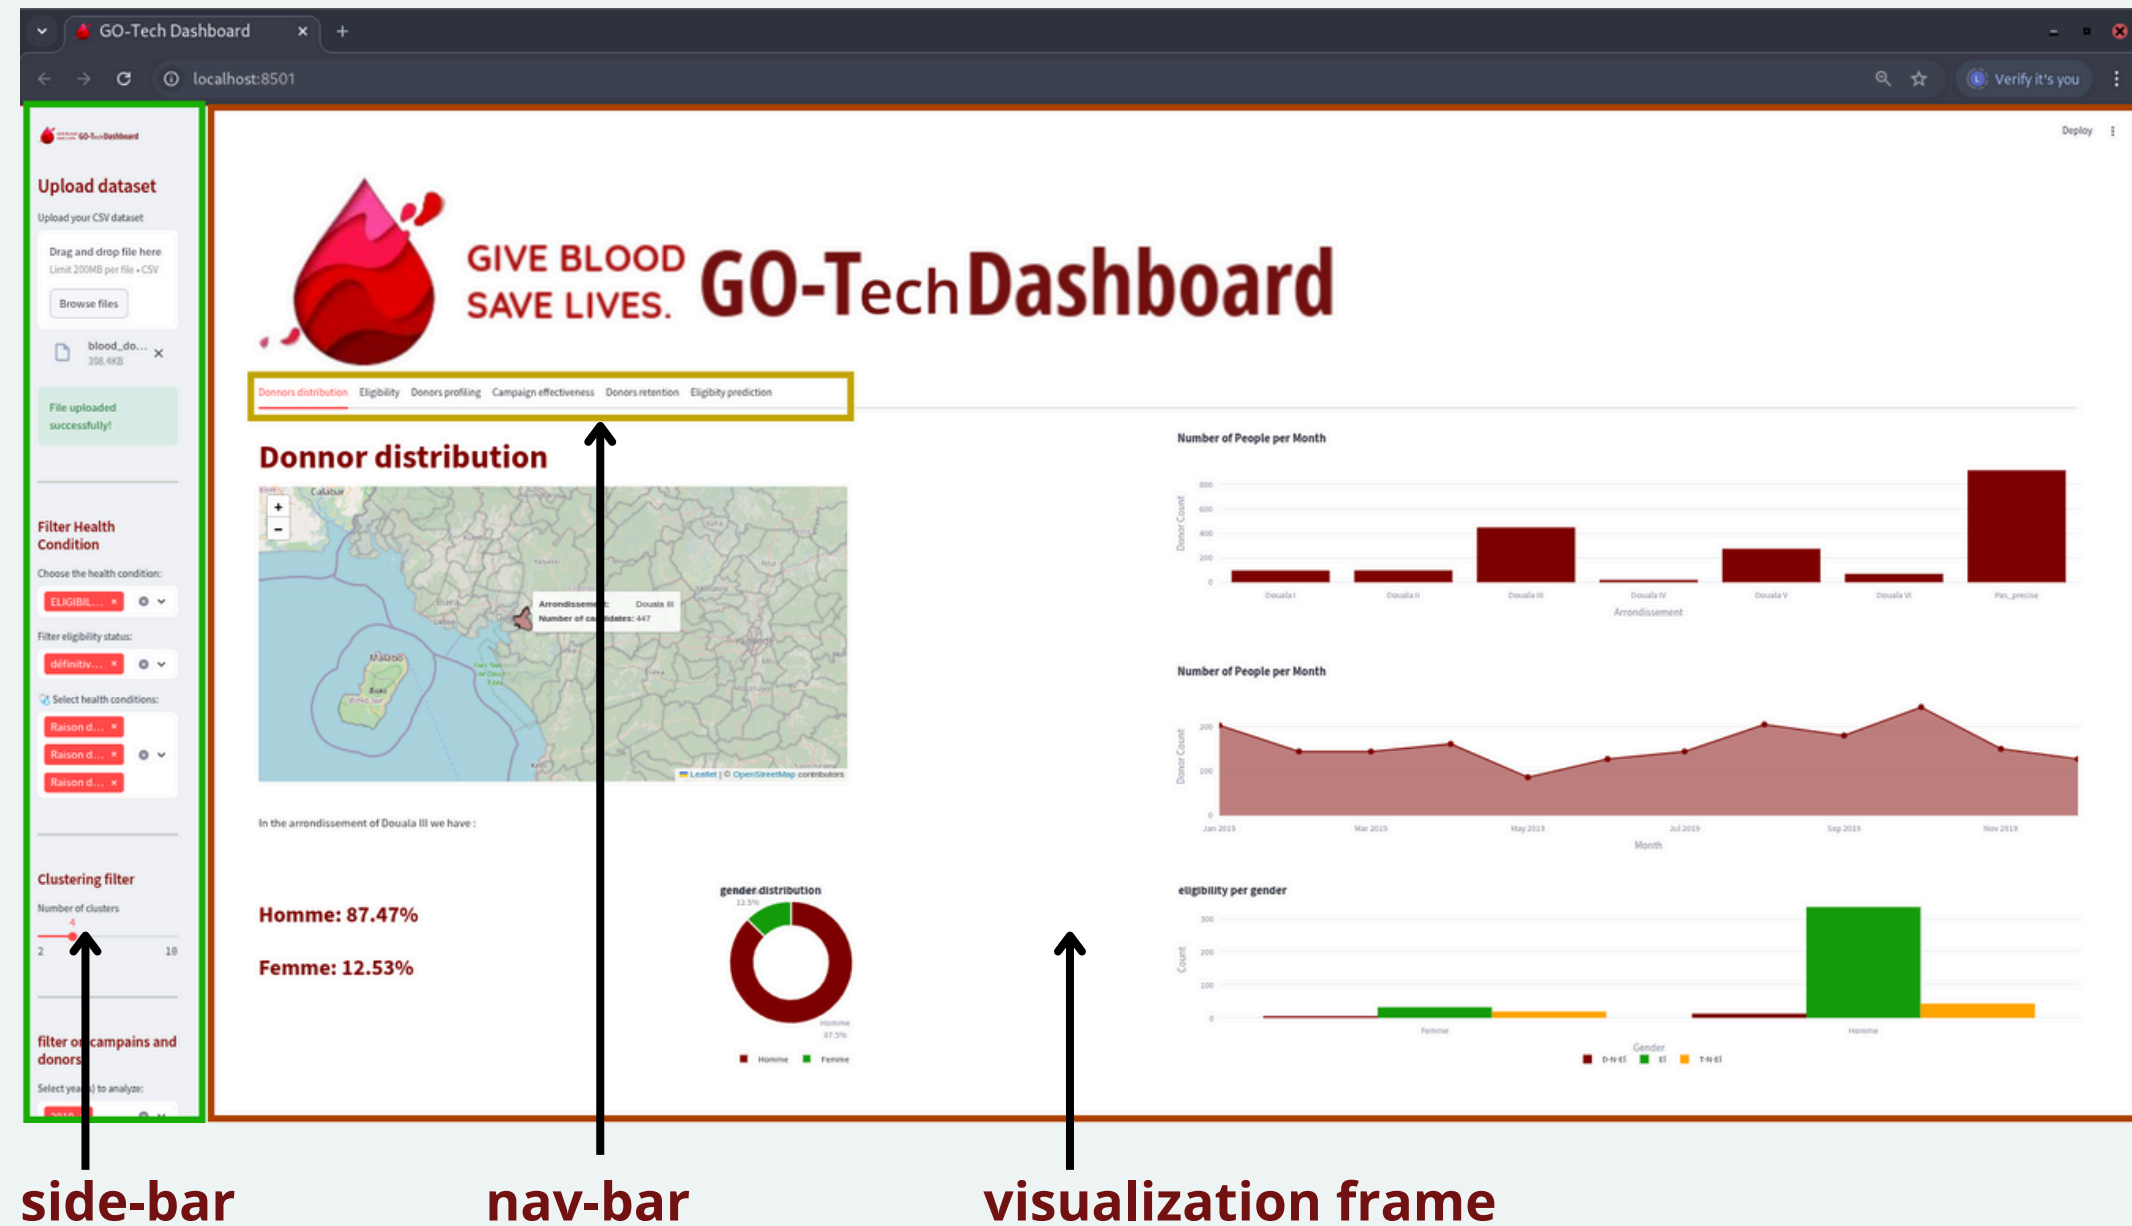

Which gives you the possibility to load and filter information as you may want.

## The nav-bar :

Suited to give users an easy way to go through various aspects and quality of information.

## The visualization frame :

The main part where visuals and insights from the extracted information are shown.

# key functionalities

As define by the proposal the dashboard answer to a series of question by giving an option in the navigation which go directly in the suited space for the visualization. these are the implemented functionalities :

Donors distribution Eligibility Donors profiling Campaign effectiveness Donors retention Eligibility prediction

**Donors distribution** : aims to visualize the geographical distribution of blood donors based on their residential area.

**Eligibility** : to see the impact of health conditions (e.g., hypertension, HIV, asthma,diabetes) on blood donation eligibility.

**Eligibility** : to see the impact of health conditions on blood donation eligibility.

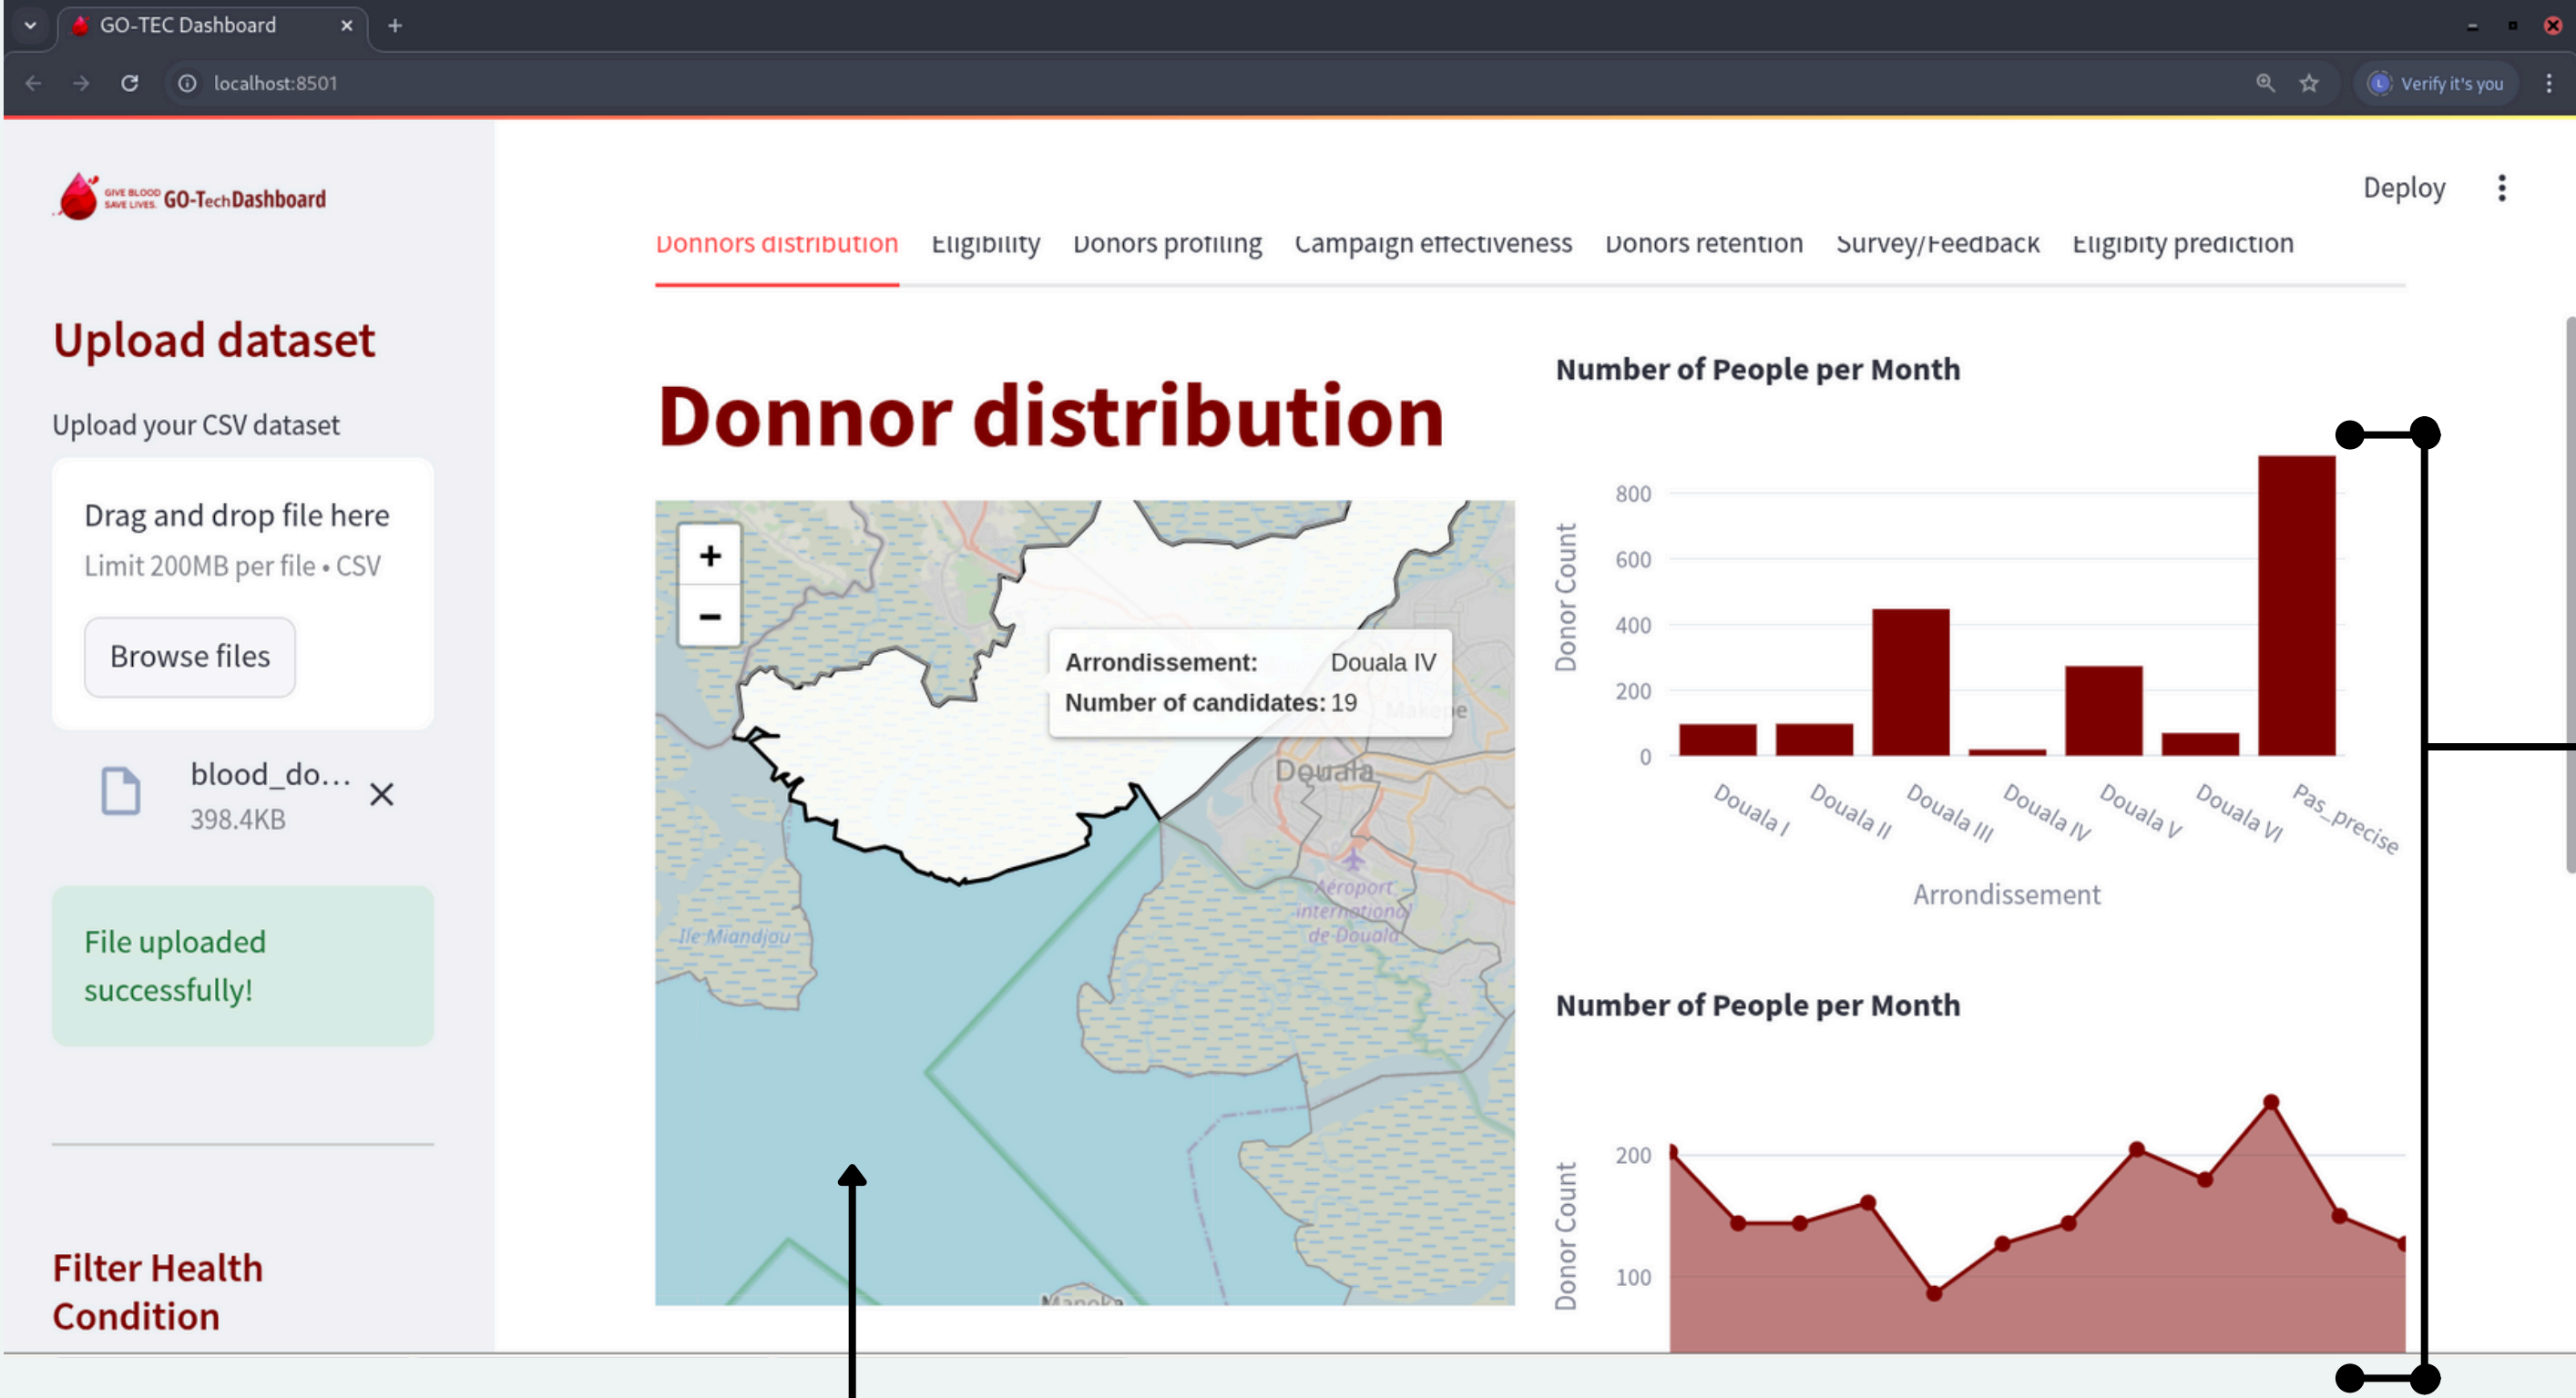

**Donors profiling** : which aim to group donors into similar profiles based on demographic and health-related features

**Campaign effectiveness** : to examine the donation date and other demographic factors.

**Donors retention** : to investigate donor retention by analyzing how often individuals return to donate blood.

**Eligibility prediction** : to predicts the eligibility of new donors based on demographic and health data.

# Conclusion

**We have present an interactive dashboard suited to enable better understanding, faster decision-making, and improvement in campaign strategies. The dashboard is focused on specific needs such as the geographical distribution of donors, the analysis of health factors, the conditions of eligibility for donation, the frequencies of donation, ...**

**The dashboard is fully implemented in python, from the preprocessing up to the prediction and it is available in github in open access.**
